

CWV Minimal Theme – Full Technical Documentation

Author: Manjeet Ahuja

Repository: github.com/manjeetahuja23/cwv-minimal-theme

Purpose: To provide a lightweight, Core Web Vitals-optimized WordPress theme inside a reproducible Docker environment with automated Lighthouse auditing.

1■■■ Dockerized WordPress Environment

This setup runs a complete WordPress + MariaDB stack inside Docker Compose. It ensures a fully isolated, reproducible environment where PHP, Apache, and MySQL all run consistently.

Why it's useful:

- 1 Eliminates environment inconsistencies ('works on my machine' issues).
- 2 Allows local testing identical to production environments.
- 3 Provides clean restarts, rebuilds, and portable deployment options.

2■■■ CWV Minimal Theme

The CWV Minimal Theme is a lightweight, accessibility-focused WordPress theme scaffolded to optimize Core Web Vitals (LCP, FID, CLS). It uses semantic HTML, lazy-loading, and minimal scripts for fast page rendering.

- 1 Improves SEO rankings via Core Web Vitals.
- 2 Delivers faster load times and minimal layout shift.
- 3 Serves as a reusable base theme for client and portfolio projects.

3■■■ Lighthouse CLI Integration

Lighthouse is Google's open-source performance and SEO auditing tool. It runs audits on metrics such as Performance, Accessibility, Best Practices, SEO, and PWA compliance.

- 1 Generates an in-depth HTML report (`docs/lighthouse-home.html`).
- 2 Measures LCP, CLS, FID, TBT, and overall SEO accessibility.
- 3 Helps improve UX and Core Web Vitals score with measurable metrics.

4■■■ GitHub Repository & CI/CD Integration

Your repository now includes the full project stack — code, Docker setup, docs, and performance reports. This makes it ready for continuous integration or team collaboration.

- 1 `theme/` – custom WordPress theme files.
- 2 `docker-compose.yml` – defines WP + DB stack.
- 3 `docs/lighthouse-home.html` – Lighthouse performance audit report.
- 4 `README.md` – setup documentation.

■ Optional Enhancements

- 1 Automate Lighthouse reports via GitHub Actions (run audits on every push).
- 2 Deploy the stack live using Render, Vercel, or AWS Lightsail.
- 3 Integrate performance badges in README (Performance, SEO, Accessibility).

■ Summary

You now have a fully functional, Core Web Vitals-optimized WordPress theme inside a reproducible Docker environment. Lighthouse ensures continuous performance validation, and GitHub versioning keeps all updates organized. This setup is ideal for developers building SEO-focused, high-speed WordPress projects.
